**FOR IMMEDIATE RELEASE****TRIAD WIRELESS ANNOUNCES THE RELEASE OF THE NEW  
S.P.I.R.I.T. SYSTEM**

Phoenix, Ariz. – May 26, 2005 – Triad Wireless, LLC is changing the way America's government agencies use wireless communications. City and State governments have long been looking to provide high-speed bandwidth solutions over large areas for police, fire, rescue services, schools, and other governmental entities. Now the solution is here—the S.P.I.R.I.T. (Secured Public Integrated Radio Infrastructure Technology) System.

The Triad Wireless S.P.I.R.I.T. System provides point-to-point, point-to-multipoint, and base-to-mobile high-speed wireless communication technology. Even better, the technology is fully monitored and secured. The Terabeam based radio system utilizes Blowfish AES encryption coupled with a full Enterasys Intrusion Detection Infrastructure. The Dragon Intrusion Detection Infrastructure protects from both sides. It is capable of integrating with existing network infrastructures so as to enhance existing networks. Security is S.P.I.R.I.T.'s highest priority. The Triad Wireless S.P.I.R.I.T. System focuses on the spirit of protection and safety and on the strength of wireless communications. S.P.I.R.I.T. offers a 4.9 GHz radio system with up to 24 Mbps and up to 35+ miles of range coverage. The system even supports full motion video in moving vehicles at a range up to 5 miles or more from the base station by utilizing it's proprietary line of antenna for greater range and lower interference. Options for the system include live cameras and recorder systems, integration with other radio infrastructures, various base and mobile options for any application, QOS service capability for VoIP applications, load-balancing and automatic fail-over for emergency situations, and integration and fail-over with local or municipal Wi-Fi or mesh type networks.

What does this mean for governments? Wireless can now go with service personnel in their vehicles. Every building in a city or area can be connected with high-speed bandwidth, on a secured private network, without having to pull a single cable. This is an excellent way for cities to create a completely integrated infrastructure for a secured and managed network.

### **About Triad Wireless, LLC**

Triad Wireless is a wireless Internet company specializing in unique RF (radio frequency) data and network designs and customized applications for local, city and state governments (including police, fire and emergency services); business enterprises and multi-tenant units; educational campuses; residential communities; and through unique partnerships with industry leaders in wireless hardware and network infrastructure and an experienced engineering team certified in wireless networking, IP network infrastructures, Cisco, Enterasys, HP and Microsoft products. Triad provides highly secure, reliable and cost effective next generation integrated data, voice, video, security and mobility wireless solutions. For more information, visit our website at [www.triadwireless.net](http://www.triadwireless.net).
